

A network graph visualization showing connections between nodes. The nodes are represented by circles and diamonds. A large cluster of nodes is located in the upper left quadrant, while other smaller clusters are in the upper right and lower right quadrants.

A network graph illustrating interactions between genes. The central node is labeled *SLC6A3*. It is connected to numerous other nodes, represented by circles and diamonds of varying sizes. Most nodes are circles, representing proteins, while a few are diamonds, likely representing RNA or small molecules. The size of the nodes indicates their degree of connectivity within the network.
